EXPERIMENT-9. Generate Text using GPT-2

```
from transformers import pipeline

generator = pipeline("text-generation", model="gpt2")

output = generator(
    "Artificial Intelligence",
    max_length=50,
    num_return_sequences=1
)

print(output[0]["generated_text"])
```

output

```
[transformers] Ignoring clean_up_tokenization_spaces=True for BPE tokenizer GPT2Tokenizer. The clean_up_tokenization post-processing step is designed for WordPiece tokenizers and is de
structive for BPE (it strips spaces before punctuation). Set clean_up_tokenization_spaces=False to suppress this warning, or set clean_up_tokenization_spaces_for_bpe_even_though_it_wil
l_corrupt_output=True to force cleanup anyway.
Artificial Intelligence, which I'm referring to here. I think it's more a combination of Artificial Intelligence and Computer Vision, but then there's also a lot of AI and robotics, an
d some of it is really cool. So I think the question for me is how to get this to work.

We've got a lot of companies that are just moving towards what we think is their ideal solution. We think there's a lot of potential for AI and robotics and human-like AI. The big ques
tion is how do you do all those things? Are you going to build a computer that can learn from all those things?

We're already working on some of those concepts. We have a list of things that we'd like to do:

A robotic system that could learn from all of those things, with a goal of learning from anything that we've built so far.

A computer that would learn how to learn from anything that we've built so far.

A system that would like to understand objects in the world on a level playing field.

A system that would like to learn from a computer that is programmed to learn from things that it has created.

A computer that would like to understand a computer.

A machine that
```
