

EXPERIMENT 22: AI in Healthcare Blog

```
from transformers import pipeline

generator = pipeline("text-generation", model="gpt2")

def generate(prompt):

    result = generator(prompt, max_length=250)

    return result[0]["generated_text"]

print("AI APPLICATIONS IN HEALTHCARE BLOG")

# Zero-shot

zero_shot = """

Write a 200-word blog on Applications of Artificial Intelligence in Healthcare.

"""

print("\nZERO SHOT:")

print(generate(zero_shot))

# One-shot

one_shot = """

Example:

Topic: AI in Education

Blog:

Artificial Intelligence helps students through personalized learning,

smart classrooms and automated assessment.

Now write a 200-word blog on Applications of Artificial Intelligence in Healthcare.

"""

print("\nONE SHOT:")

print(generate(one_shot))

# Few-shot

few_shot = """

Example 1:
```

```

IDLE Shell 3.14.2
File Edit Shell Debug Options Window Help

Topic: AI in Banking
Blog:
AI improves fraud detection and customer services.

Example 2:

Topic: AI in Agriculture
Blog:
AI helps farmers with crop prediction and monitoring.

Now write a 200-word blog on Applications of Artificial Intelligence in Healthcare.

In this example, I will use the Java API to create a web-based AI-based system for agriculture and banking.

To use the Java API, simply create a Java file and a class that will look like this:

I have created a Java class that can be used to generate a Java application for the following reasons:

It is not a real Java file
It is not a web page
It is not a database
It is not a database file
It is not a database file
It is not a database file
There is no dependency on any other Java file.

This class will be written in Java and you can use the Java class to build your application.

However, if you want to use the Java API in the application you would have to create a Java file that will contain some necessary classes and libraries that will allow you to build a Java application.

To build a Java application, you will need to create an application file. This file will contain a Java class that will be used to generate a Java application for the following reasons:

There is no dependency on any other Java file.

It is not a real Java file
It is not a database file
It is not
