

EXPERIMENT-19. Generate Text from Prompt

```
from transformers import pipeline
```

```
generator = pipeline("text-generation", model="gpt2")
```

```
prompt = "Artificial Intelligence is"
```

```
result = generator(prompt, max_length=60)
```

```
print(result[0]["generated_text"])
```

output

Prompt: Artificial Intelligence is

Generated Text:

Artificial Intelligence is already being used to create the world's next generation of artificial intelligence. Researchers from the University of California, San Diego and the University of California, Berkeley are taking advantage of artificial intelligence to create new kinds of data processing machines, and now scientists are working on a new design for artificial intelligence that could eventually be used in artificial intelligence.

The machine could be used to generate a map of the world, a way to track a person or a small object, or to help people with disabilities.

"The idea is that this is something that could be used in a very large amount of ways," said James J. Pimentel, a professor of computer science at the University of California, Berkeley, who is helping develop the machine. He is currently working on a tool that could be used to look at a person's hand or a piece of paper or even a person's head.

"It would be very interesting if it could be used to measure movements of a person."

The machine would be able to take a picture of the person's hand or paper and then scan it for a new location, Pimentel said. The machine could also be used to track a person's movements at a distance, he added. The design could be applied to
