

EXPERIMENT20. Compare Responses for Multiple Prompts

```
from transformers import pipeline

generator = pipeline("text-generation", model="gpt2")

prompts = [

    "Artificial Intelligence",

    "Python Programming",

    "Future Technology"

]

for prompt in prompts:

    print("Prompt:", prompt)

    output = generator(prompt, max_length=40)

    print(output[0]["generated_text"])

    print("-"*50)
```

output

```

Prompt: Artificial Intelligence
[transformers] Passing 'generation_config' together with generation-related arguments=({'max_length'}) is deprecated and will be removed in future versions. Please pass either a 'generation_config' object OR all generation parameters explicitly, but not both.
[transformers] Both 'max_new_tokens' (=256) and 'max_length' (=40) seem to have been set. 'max_new_tokens' will take precedence. Please refer to the documentation for more information.
(https://huggingface.co/docs/transformers/main/en/main_classes/text_generation)
[transformers] Ignoring clean_up_tokenization_spaces=True for BPE tokenizer GPT2Tokenizer. The clean_up_tokenization post-processing step is designed for WordPiece tokenizers and is destructive for BPE (it strips spaces before punctuation). Set clean_up_tokenization_spaces=False to suppress this warning, or set clean_up_tokenization_spaces_for_bpe_even though it will corrupt output=True to force cleanup anyway.
Artificial Intelligence: A Biggest Surprise

In the past couple of years, scientists have reported that artificial intelligence can be used to solve basic problems. But that didn't mean it could actually solve problems.

In 2010, for example, a team of scientists at the University of California, Berkeley, used artificial intelligence to solve a puzzle in a computer game called Scrabble, in which players use a pen to decipher words. Their results were accepted by the U.S. National Academy of Sciences.

AI is more powerful than humans in a number of ways. They're more likely to know what they are doing than human beings, and they're smarter than machines. But they're also more likely to be able to solve complex problems - like whether you're at a computer or in a house. The new research suggests there are two general types of artificial intelligence in use today: those that are more productive and ones that are less productive.

"There is a lot of work ahead on this," says lead author David Sperry, a computer scientist at the University of California, Berkeley. "There is a lot of research that's starting to show that they are very effective at solving complex problems."

So far, one of the most promising developments in artificial
```

Prompt: Future Technology

[transformers] Both 'max_new_tokens' (=256) and 'max_length' (=40) seem to have been set. 'max_new_tokens' will take precedence. Please refer to the documentation for more information.
(https://huggingface.co/docs/transformers/main/en/main_classes/text_generation)

Future Technology has been working on these for quite some time. It has been one of the most exciting projects in the history of robotics.

What is a robot?

A robot is a robotic device that is able to walk, talk, dance, and perform certain tasks. Its main role is to perform tasks like lifting, bending, picking up objects, and doing other tasks.

The name robot comes from the Latin verb robotus, meaning "to walk."

What happens when the robot is out of the way?

The robot will not be stationary, and will not walk. Instead, it will continue to perform certain tasks, such as performing a task for one second, bending a chair, or picking up objects in the air (such as a bicycle).

What are the differences between robots and humans?

Robots are more like humans, because they move and act on their own volition. They tend to move in a direction that is unique to each individual.

Robots can be used for many different tasks. A robot can be used for a task that involves moving a chair, carrying a suitcase, or even picking up a child. A robot can be used for a task that involves picking up or removing objects or objects

Prompt: Python Programming

[transformers] Both 'max_new_tokens' (=256) and 'max_length' (=40) seem to have been set. 'max_new_tokens' will take precedence. Please refer to the documentation for more information.

Python Programming Language

The Python Programming Language is the Python programming language that is used for the programming of computer graphics. The language has been developed by the University of Michigan, the University of California, Santa Barbara, the University of California, San Diego, the University of California at Berkeley, the University of California, Berkeley, the University of California at Santa Cruz, the University of California, Berkeley, and the University of California, Santa Cruz.

The language was originally developed as a programming language for the University of Michigan and the University of California at Santa Barbara. In this way, the language is known as the "python programming language."

The language was written in C.

The language has been ported to Python 2.7.2.

The Python 2.7.2 release was released on June 18, 2013, and the Python 2.7.2 release was released on June 24, 2013.

The Python 3.6.2 release was released on May 5, 2014 and the Python 3.6.2 release was released on May 17, 2014.

The Python 3.6.2 release was released on June 30, 2014.

The Python 3.6.2 was released on June 30, 2014.
